Prompt Iterations

1. Create a Snake Game App using HTML/CSS/JavaScript

Issue: For some reason when the snake ate the first food the speed got multiplied (increased) but the grid (playing area and the snake character) disappeared. The Restart button did not work. The grid appeared for a split second and it just disappeared itself.

2. The game's play area disappears soon after the snake eats the first piece of food and the speed multiplies. The Restart button is also not working. I have to reload the webpage itself to play the new game. Also add a clear grid that shows in which row/column the snake is in and where the food is located.
3. ok. that issue is now fixed. Now on the Nokia theme we can not distinguish between the standard food and the larger prizes (like shield foot item etc.). Fix that. Maybe add a larger food particle or whatever feels better. Also, I think the bonus food items (turbo speed, shield etc.) shouldn't be part of the "standard food". They should appear at random times and for only a limited time. the bigger the prize, the less amount of time it should appear for. Also add a new Maze Play Mode in addition to Classic, Portal and Obstacles and the mazes should be larger. The obstacles are too small. And at the end of the game (game over) not only show a popup to restart but add in the score for that try and display a message if the user scored their highest. Also it is not Retry rather it is Restart.
4. Now the next thing to do is to change the layout. Right now, the scoreboard is appearing on the top right side but it should appear right above the playing grid. Also add an icon to the webpage where the icon should contain a snake's image.
5. Also the grid numbers depicting in which cell the snake is or the target is and the speed multipliers are unnecessary, remove them.
6. Add a button named Arcade Settings, clicking upon which the user sees a Modal or a popup which contains all the options regarding the game difficulty, grid dimensions, mode, wall physics settings, theme and audio settings. And also add some separator lines in between each section so that they are distinguishable from each other. And on the main screen, the game difficulty (current one), the grid size and the play mode are visible. Increase the game play area, right now it's a bit compressed. And align it centrally.
7. Remove the Speed Boost Progress bar entirely. also, add the current wall settings (Wrap/Solid) to the indications next to Mode. And on the settings modal, add a one-liner description to the wall setup. Remove "Championship Edition" text. And move the Settings button to the left of the Reload Main button. Decrease the scoreboard's height just a little bit.

Issue: Should have been smart enough to deduce that I do not want the Arcade Settings button in the Arcade Settings section. But it added redundancy there.

So I manually had to ask it to remove the Arcade Settings button from the Arcade Status panel. Decrease the height of Arcade Status and Score so that they are readable but do not take too much space vertically.

What worked

Detailed instructions, telling the model what to do and systemic thinking.

What did not work

The model did not make sound decisions regarding the design itself at times.

Challenges

Sometimes the LLM did not fully understand my requirements. I then asked it to devise a plan, ask clarifying questions rather than assume stuff. Only when everything seemed Ok did I ask it to implement.

Also, at times when I thought the model would be intelligent enough to remove redundancy by itself, it did not. I had to ask it myself regarding what to remove and why, where to position the buttons, the interface etc.
