Prompts

1.

1) I have a video in YouTube that is in Urdu and the transcripts are in Hindi. Can you generate key points out of it if I give you just the YouTube link, ideally (not the entire video) or if I give you the Hindi transcripts.? Or are there any FREE tools that can do that?

2) how can I copy the entire transcripts from the youtube video if I am running YouTube from the Android YouTube app?

Key things: I do not want to download the video. The transcriber should be free (if it is something other than what Google provides). The audio of the video will be in Urdu and the transcripts in Hindi. Ideally I should be able to generate the English transcripts using the URL. Those transcripts will then be used to get the key points (and later generate the slides).

2. Ok. I am giving you the video link. Generate the English transcripts/subtitles of that video.

 01: Introduction to General Agent Problem Solving

3. Great. Now generate the key points of these transcripts. But do not add the instructor intro and question answers and do not divide the key points with regards to instructor sections. Just keep the continuity.

Also, ask any questions you have before actually generating the key points.

The key points are important and I want to generate the slides out of them. The slides should be 20-30 and arranged in thematic sections. Like what is diff between AI and Agentic AI, what does Agentic AI do, etc.

4. ok. now generate the slide content:

Create a presentation for beginner software engineers.

Audience:

Beginner developers

Requirements:

- Modern style
- One idea per slide
- Minimal text
- Include examples
- Include diagrams where useful

- Include speaker notes
- Keep 20 slides maximum

Return:

Title

Subtitle

Bullet points

Suggested visual

5. simplify explanations, remove repetition, improve sequencing, add analogies and real-world examples where applicable, add industry practices, add diagrams where applicable, highlight best practices

6. the above key points you generated encompass 20 slides. reduce them to like 10 slides. keep focus on how Agentic AI is transforming the software engg industry and development. no need to go deep into the types of AI and what even AI is etc.

Then I gave all the key points to Gamma AI and it created the presentation.

Prompts that Worked Effectively

The transcript extraction, key points generation, presentation format and summarizing the points worked perfectly.

Prompts that did not Work

Gemini needed to know the audience and when it did not have that information, it generated generic slides points. Also, it did not present the points in a typical presentation format initially.

How the Prompts were Refined

Once I provided enough context and constraints, it generated what I was looking for in the first place.

The Complete Process Followed

- Generated the transcripts for the YouTube video lecture using Gemini
- Used Gemini to summarize the transcripts and generate the key points in a presentation format
- Used Gamma to generate professional, modern slides out of those keypoints

AI Tools Used

Gemini and Gamma
